#### 1. Introduction

#### 1.1. Context

The printer emulation is a new feature on 3.0 firmware. With this functionality you can print from your Commodore 64/128 using an emulated IEC device #4 or #5.

This emulation simulates a Commodore MPS-1230 printer with all the commands that this printer can understand. Not all commands are executed as some of them are hardware related and cannot obviously be implemented. The results are printed to PNG image files, one file per page. You can also choose to bypass the printer emulation and to send the raw data from #4 or #5 IEC device to a file.

MPS-1230 was a mid-range black ink ribbon 9 needle matrix printer sold by Commodore in the late 80's.

This printer is compatible with nearly all the usual programs that have been edited for C64/C128. It can emulate 4 printer instruction sets:

- Commodore MPS-801
- Epson FX-80
- IBM Graphics Printer
- IBM Proprinter

## 1.2. Purpose of this document

This document describes how to use and configure the Ultimate-II embedded printer emulation.

You will also find all the commands and charsets supported by the printer. Then you can add printer facility to your own BASIC programs!

## 2. Configuration

#### 2.1. Overview

You will find all the configuration items for the printer in the IEC configuration menu.

#### 2.2. Enable the printer

To enable the printer, you need to enable the software IEC feature in the Ultimate-II:

- Use the F2 Menu to enter Ultimate-II configuration and then select "Software IEC Settings"
- Then on item "IEC Drive and Printer" select "Enabled"

## 2.3. Printer configuration items

• **Printer Bus ID**: 4 or 5 (default is 4)

This will assign device ID 4 or 5 to the printer.

• **Printer output file**: default is /SD/printer

You can select file base name that the printer emulation will use to create the PNG files. If you choose to generate PNG files they will be named /SD/printer-001.png, /SD/printer-002.png, and so on. If you chose the bypass the emulation and write raw data to disk the file will be named /SD/printer with no extension.

• **Printer output type**: PNG or RAW (default is PNG)

PNG are images created by the printer emulator each time a page is ejected from the printer. Caution, if a file with the same name already exists, it will not be overwritten and the page is lost. RAW is the data directly sent by the C64/128 to the IEC port and recorded to a file. If the file already exists, the new data will be appended to it.

• **Printer ink density**: Low, Medium or High (default is Medium)

You can consider this as "how strong is the pin impact on the paper". *Low* will only print very small dots and *High* larger dots. As a consequence, this will change the resulting contrast. *High* gives the best result for DRAFT character mode. *Medium* may be well suited for NLQ character mode. Just test and see what match your needs.

 Printer emulation: Commodore MPS, Epson FX-80, IBM Graphics Printer, IBM Proprinter (default is Commodore MPS)

You can select which instruction set the emulator will recognize. Changing from one emulation to another will reset the printer attributes but the printer head stays at the same place and the page is not ejected.

• **Printer Commodore Charset:** USA/UK, Denmark, France/Italy, Germany, Spain, Sweden, Switzerland (default is USA/UK)

Select which charset to use when using Commodore MPS emulation. If you don't know which one to choose, USA/UK is the one you want. See Commodore charset description on chapter 19.

- **Printer Epson Charset:** Basic, USA, France, Germany, England, Denmark I, Sweden, Italy, Spain, Japan, Norway, Denmark II (default is Basic)
  Select which charset to use when using Epson FX-80 emulation. See Epson charset description on chapter 10.
- **Printer IBM Charset:** International 1, International 2, Israel, Greece, Portugal, Spain (default is International 1)

Select which charset to use for Table 2 when using IBM Graphics Printer or IBM Proprinter emulation. See IBM charset description on chapter xx. IBM printer can use 2 charsets: Table 1 and Table 2. Table 1 cannot be modified and is the default charset. Table 2 is the one you chose with this parameter. See IBM charset description in chapter 11.

## 3. Using the printer

## 3.1. Printing from the C64/C128

Just use your program and tell it that you have a connected printer compatible with MPS Commodore series (e.g.: MPS-801/MPS-803 are the most frequently supported commodore printers).

## 3.2. Flushing the printer spool

The printer has a very small buffer (128 bytes) and some data may still be in the buffer waiting to be printed when your print job is finished. The printer doesn't know that your job is finished and waits for more data to print until the end of the page.

You need to tell the printer that you want all the buffered data to be printed and to eject the current page. This works as the *Form Feed* button on the real MPS-1230 to eject the page.

Go to F5 Menu and select "**Flush Printer/Eject Page**". In PNG mode, this will make the current page to be written to a file. Next print job will start on a blank page. In RAW mode this will write the buffered data to the file.

## 3.3. Resetting the printer

You may need to reset printer to go back to an initial state. Go to F5 Menu and select "**Reset IEC and Printer**". Current data in printer buffer is lost. Current page that was being printed is also lost.

#### 3.4. Performances

Composing a page full of text and creating the PNG file will need approximatively 15 seconds on the Ultimate-II (28 seconds using NLQ mode). You may think it's slow but this is much faster than a real MPS-1230 printer (1 min in DRAFT mode, 4 min in NLQ mode)!

At this time, with firmware 3.0 beta, the Ultimate-II middle button becomes unresponsive while composing a page. The green LED on the right of the cartridge is lit when printer is working. Be patient and look at the activity LED to stop blinking.

RAW mode is nearly immediate. There is no process time to wait.

# 4. Capabilities

This table summarize the printer capabilities depending on which printer emulation is active :

	Commodore MPS	Epson FX-80	IBM Graphics Printer	IBM Proprinter
Draft	•	•	•	•
Double strike	•	•	•	•
Bold	•	•	•	•

\_

 $<sup>^{*}</sup>$  Only in Ultimate-II MPS Printer Emulation, not available on a real MPS-1230 printer

#### 5. Commodore MPS commands

This chapter describes the commands the printer can understand when using the Commodore MPS emulation. You will find Commodore BASIC examples to explain you how to use them. This printer uses PETASCII.

## 5.1. Simple example

This will print a first line with HELLO WORLD! on it and a second line with HELLO printed with double width characters.

```
10 OPEN1,4
20 PRINT#1,"HELLO WORLD!"
30 PRINT#1,CHR$(14)"HELLO"
40 CLOSE1
HELLO WORLD!
```

#### 5.2. Secondary address

Only on Commodore MPS emulation, you can specify an optional secondary address on OPEN:

- **0** : Select PETASCII charset with uppercases and graphic chars
- 7 : Select PETASCII charset with lowercases and uppercases

If no secondary address is specified, 0 is the default.

## 5.3. Commands

#### 5.3.1. Graphical operations

```
ESC g
               Select the Double Strike print mode. Characters are printed twice and paper is
2771
               lifted 1/216" between the two passes.
1Bh 47h

20 PRINT#1, CHR\$(141);

30 CLOSE1

#### 5.3.3. Format control

**ESC c n** Defines the page length in number of text lines (range 1-127).

27 67 n

**1Bh 43h n** 10 OPEN1,4,7

20 PRINT#1, CHR\$(27); CHR\$(67); CHR\$(1-127);

30 CLOSE1

**ESC c NUL n** Defines the page length in inches (range 1-22).

27 67 0 n

1Bh 43h 00h n 10 OPEN1,4,7

20 PRINT#1, CHR\$(27); CHR\$(67); CHR\$(0); CHR\$(1-22);

30 CLOSE1

**ESC n m** Define the **Bottom of Form** (BOF) in number "m" of interlines at the end of the page

**27 78 m** that are not used to print and are automatically skipped.

**1Bh 4Eh m** This command is ignored by Ultimate-II MPS Printer Emulation.

10 OPEN1,4,7

20 PRINT#1, CHR\$(27); CHR\$(78); CHR\$(m);

30 CLOSE1

**ESC o** Disable the **Bottom of Form** (BOF).

**27 79** This command is ignored by Ultimate-II MPS Printer Emulation.

#### 1Bh 4Fh

10 OPEN1,4,7

20 PRINT#1, CHR\$(27); CHR\$(79);

30 CLOSE1

# ESC 8 27 56

Disable the end of paper detector to be able to print until the end of the paper.

This command is ignored by Ultimate-II MPS Printer Emulation.

1Bh 38h 10 OPEN1,4,7

20 PRINT#1, CHR\$(27); CHR\$(56);

30 CLOSE1

# ESC 9

Enable the end of paper detector.

27 57 1Bh 39h This command is ignored by Ultimate-II MPS Printer Emulation.

10 OPEN1,4,7

20 PRINT#1, CHR\$(27); CHR\$(57);

30 CLOSE1

# HTAB

9 09h This is the traditional horizontal tabulation. Head jumps to the next tabulation stop. Stops are located every 8 PICA character position since the beginning of a line. This is fixed, not configurable.

10 OPEN1,4

20 PRINT#1, CHR\$(9); "THIS IS THE PRINT POSITION 8"

30 CLOSE1

## POS $n_1 n_2$ 16 $n_1 n_2$ 10h $n_1 n_2$

On the current line, jump to the horizontal position corresponding to the  $n_1n_2$  decimal number of PICA characters since the beginning of the line. Each parameter is a value between 0 and 9. 00 is the position of the first character.  $n_1n_2$  can range from 00 to 79. Does nothing is current position is already over the  $n_1n_2$  position.

10 OPEN1,4

20 PRINT#1, CHR\$(16); CHR\$(2); CHR\$(6); "THIS IS THE PRINT POSITION 26"

30 CLOSE1

## ESC POS n<sub>1</sub> n<sub>2</sub> 27 16 n<sub>1</sub> n<sub>2</sub> 1Bh 10h n<sub>1</sub> n<sub>2</sub>

On the current line, jump to the horizontal position corresponding to the dot position given by parameters  $n_1$  and  $n_2$  from the beginning of the line. Parameter is calculated using the formula  $n_1 \times 256 + n_2$ . Value range is 0 to 480

#### Examples:

$\mathbf{n_1}$	$\mathbf{n}_2$	POSITION
CHR\$(0)	CHR\$(20)	0 + 20 = 20
CHR\$(1)	CHR\$(0)	256 + 0 = 256
CHR\$(1)	CHR\$(224)	256 + 224 = 480

10 OPEN1,4

20 PRINT#1, CHR\$(27); CHR\$(16); CHR\$(1); CHR\$(6); "THIS IS THE PRINT

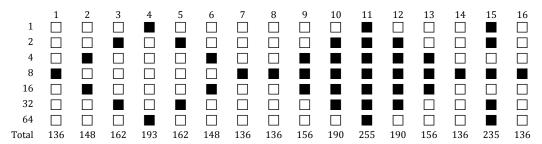

POSITION 262"

30 CLOSE1

#### 5.3.4. Graphic Bitmap

Printer can print graphic data using the Bit Image Mode (BIM). An image is defined by a bit array of 7 rows. Each column is encoded in a byte, LSB is up, MSB is not printed and always set to 1. Horizontal definition is 60 dpi. Vertical definition is 72 dpi.

Example for a 16 columns array:

Don't forget that bit 27 is <u>always</u> set, this adds 128 to each value.

First byte with 2<sup>7</sup> bit not set means that BIM data has ended. As BIM is always printed using the double width mode, you can use code **EN OFF** (15 0Fh) to tell the printer that BIM data has ended.

When in BIM, interline is automatically set to 7 dot height.

BIT IMG 8 08h Select the **Bit Image Mode**. Provided data is printed as an array of dots as described above. Maximum BIM data width that can be printed on printable area is 480 dots.

```
10 OPEN1,4,7
20 A$="""
30 FOR I=1 TO 16
40 READ A:A$=A$+CHR$(A)
50 NEXT I
60 FOR J=1 TO 3
70 PRINT#1,CHR$(8);A$
80 NEXT J
90 CLOSE1
100 END
110 DATA 136,148,162,193,162,148,136,136
120 DATA 156,186,255,186,156,136,235,136
```

BIT IMG SUB n 8 26 n 08h 1Ah n Select the repeated Bit Image Mode. The BIM data is printed n times on the same row. If n=0 data will be repeated 256 times. If you need more than 256 repetitions, you will have to call BIT IMG SUB with the data several times.

BIM data size must be less than 255 bytes, extra data is ignored.

```
10 OPEN1,4,7
20 A$="""
30 FOR I=1 TO 16
40 READ A:A$=A$+CHR$(A)
50 NEXT I
```

```
60 FOR J=1 TO 3
70 PRINT#1,CHR$(8);CHR$(26);CHR$(10);A$
80 NEXT J
90 CLOSE1
100 END
110 DATA 136,148,162,193,162,148,136,136
120 DATA 156,186,255,186,156,136,235,136
```

## 5.3.5. Character creation, Down Line Loading (DLL)

On a MPS-1230 user can create from 1 to 94 custom characters to replace normal characters. These characters are loaded in RAM. Consecutive characters can be defined in a single sequence beginning by the first character. DLL has to be enabled in the configuration of a real MPS-1230 printer and RAM buffer is smaller as a part of the RAM is reserved for DLL.

On Ultimate-II MPS Printer Emulation, DLL is not available but commands are correctly recognized and skipped with all their data.

ESC = 27 61 1Bh 3Dh

This code has to be followed by parameters  $m \ n \ c \ s \ a \ p_1 \ p_2...p_{11}$  which represents decimal byte codes to describe characters to load.

m and n are the number of bytes to load. Use the formula  $t = (number\ of\ chars\ x\ 13)\ + 2$  then calculate m and n in order to have m + (n x 256) = t using formulas  $n = t\ /\ 256\ (keep\ entire\ part\ only)$   $m = t - (n\ x\ 256)$ 

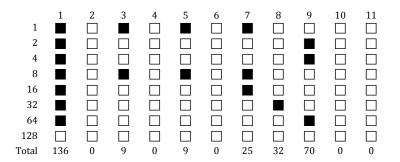

E.g.: for 94 characters, t = (94 x 13) +2 = 1224 n = 1224 / 256 = 4 m = 1224 - (4 x 256) = 200

- c Is the decimal ASCII code of the first character of the sequence. Only decimal codes from 33 to 126 can be used for DDL. Code 65 is "A"
- s Is a constant value 20 (14h) (missing from official documentation but present in all examples)
- a This parameter tells which needles have to be used to print that character. Head has 9 needles of which 8 can be used here.

  a = 0: use the 8 upper needles

  a = 1: use the 8 lower needles

 $\mathbf{p_1} \, \mathbf{p_2} \dots \mathbf{p_{11}}$  Represents the 11 columns defining the dots printed for the character.

This represents the real R character in DRAFT quality.

In the 8x11 matrix you have to remind that a dot active in a column cannot be active in the next column to let the head recycle. Ultimate-II MPS Printer emulator does not suffer from this limitation.

Note from the author: I tested this command on a real MPS-1230 because explanations given by Commodore seems to be false. I can't make it work, example in the MPS-1230 manual prints nothing. Where are the 13 bytes by character? I only count 12 ( $a p_1 p_2...p_{11}$ )

ESC i n 27 73 n 1Bh 49h n Select the print quality depending on parameter "n"

- n=0 standard quality (draft) and normal characters
- n=2 near letter quality (NLQ) and normal characters
- n=4 standard quality (draft) and special characters created with Down Line Loading (DLL). Not supported on Ultimate-II MPS Printer Emulation, same behavior as n=0.
- n=6 near letter quality (NLQ) and special characters created with Down Line Loading (DLL). Not supported on Ultimate-II MPS Printer Emulation, same behavior as n=2.

#### 6. EPSON FX-80 commands

This chapter describes the commands the printer can understand when using the Epson FX-80. This was one of the most popular printers in the 80's for its powerful graphic instruction set. With this emulation you can reach the maximum graphical resolution the printer can print (240x216dpi). This is still much lower than modern printers. This printer uses ASCII7.

## 6.1. Secondary address

Secondary address on OPEN command is not used by Epson FX-80 emulation.

#### 6.2. Commands

#### 6.2.1. Graphical operations

ESC G 27 71 1Bh 47h	Select the <b>Double Strike</b> print mode. Characters are printed twice and paper is lifted $1/216$ " between the two passes.

```
10 OPEN1,4
20 PRINT#1,CHR$(27);CHR$(66);CHR$(5);CHR$(10);CHR$(15);CHR$(0)
30 CLOSE1
```

## ESC D n<sub>1</sub> ... 0 27 68 n<sub>1</sub> ... 0 1Bh 44h n<sub>1</sub> ... 0

Define the **horizontal tabulation stop program**. Each value **n** represents a character position where to set a tab stop in ascending order. Last one is 0 to tell that the sequence has ended. Up to 32 stops can be created. Current char pitch is used to calculate tab position in the line.

```
10 OPEN1,4
20 PRINT#1,CHR$(27);CHR$(68);CHR$(10);CHR$(20);CHR$(30);CHR$(0)
30 CLOSE1
```

```
ESC b m n_1 ... 0 27 98 m n_1 ... 0 1Bh 62h m n_1 ... 0
```

Define a **vertical tabulation stop program**. You can define up to 8 programs (**m**=0-7). Each value **n** represents a line number where to set a vertical tab stop in ascending order. Last one is 0 to tell that the sequence has ended. Up to 32 stops can be created per program. Current line spacing is used to calculate tab position in the page. Use **ESC** / to activate the program. Previous command **ESC B** modifies only the current program. Default current program is 0.

```
10 OPEN1,4
20 PRINT#1,CHR$(27);CHR$(98);CHR$(7);CHR$(5);CHR$(25);CHR$(0)
30 CLOSE1
```

## ESC / n 27 47 n 1Bh 2Fh n

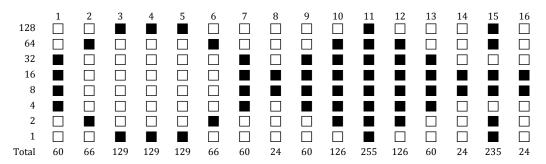

Activate one of the 8 possible vertical tabulation stop programs. Value  ${\bf n}$  is program number from 0 to 7.

```
10 OPEN1,4
20 PRINT#1,CHR$(27);CHR$(47);CHR$(n);
30 CLOSE1
```

#### 6.2.4. Graphic Bitmap

Epson emulation car print bitmap data. An image is defined by a bit array of 8 rows. Each column is encoded in a byte, MSB is up. Horizontal definition can be one of 60, 120 or 240 dpi. Vertical definition is 72 dpi.

Example for a 16 columns array:

Prior to BIM printing you need to change the line spacing to match the graphic height. Standard line height in graphic mode is 1/9" (8/72") if you use 8 dots or 7/27" if you use 7 dots.

ESC K ... Select the Bit Image Mode in simple density. You have to provide parameters  $n\ m$  27.75 ...  $d_1\ d_2\ ...$ 

Values **n** and **m** are the 16 bit encoded amount of data (n is LSB) total =  $n + m \times 256$  **d**<sub>1</sub> **d**<sub>2</sub> ... are the bitmap data to print. Default resolution using **ESC K** is 60 dpi but it can be changed using command **ESC**?

```
10 OPEN1,4
20 A$=CHR$(27)+CHR$(75)+CHR$(16)+CHR$(0);
30 FOR I=1 TO 16
40 READ A:A$=A$+CHR$(A)
50 NEXT I
60 PRINT#1,CHR$(27);CHR$(65);CHR$(8);CHR$(10);CHR$(13)
70 FOR J=1 TO 3
80 PRINT#1,A$;A$;A$;A$;CHR$(10);CHR$(13)
90 NEXT J
100 CLOSE1
110 END
120 DATA 60,66,129,129,129,66,60,24
130 DATA 60,126,255,126,60,24,235,24
```

ESC L ... 27 76 ... 1Bh 4Ch ... Select the  $Bit\ Image\ Mode$  in double density, half speed. You have to provide parameters  $n\ m\ d_1\ d_2\ ...$ 

Values **n** and **m** are the 16 bit encoded amount of data (n is LSB) total =  $n + m \times 256$  **d**<sub>1</sub> **d**<sub>2</sub> ... are the bitmap data to print. Default resolution using **ESC L** is 120 dpi but it can be changed using command **ESC**?

```
10 OPEN1,4
20 A$=CHR$(27)+CHR$(76)+CHR$(16)+CHR$(0);
30 FOR I=1 TO 16
40 READ A:A$=A$+CHR$(A)
50 NEXT I
60 PRINT#1,CHR$(27);CHR$(65);CHR$(8);CHR$(10);CHR$(13)
70 FOR J=1 TO 3
80 PRINT#1,A$;A$;A$;A$;CHR$(10);CHR$(13)
90 NEXT J
100 CLOSE1
110 END
120 DATA 60,66,129,129,129,66,60,24
130 DATA 60,126,255,126,60,24,235,24
```

**ESC Y ...** Select the **Bit Image Mode** in double density, normal speed.

27 89 ... On Ultimate-II MPS Printer Emulation, ESC Y behaves the same as ESC L

1Bh 59h ...

ESC Z ... 27 90 ... 1Bh 5Ah ... Select the **Bit Image Mode** in quadruple density, half speed. You have to provide parameters  $n\ m\ d_1\ d_2\ ...$ 

Values  $\bf n$  and  $\bf m$  are the 16 bit encoded amount of data (n is LSB) total = n + m x 256  $\bf d_1 \, \bf d_2 \, ...$  are the bitmap data to print. Default resolution using **ESC Z** is 240 dpi but it

can be changed using command ESC?

```
10 OPEN1,4
20 A$=CHR$(27)+CHR$(90)+CHR$(16)+CHR$(0);
30 FOR I=1 TO 16
40 READ A:A$=A$+CHR$(A)
50 NEXT I
60 PRINT#1,CHR$(27);CHR$(65);CHR$(8);CHR$(10);CHR$(13)
70 FOR J=1 TO 3
80 PRINT#1,A$;A$;A$;A$;CHR$(10);CHR$(13)
90 NEXT J
100 CLOSE1
110 END
120 DATA 60,66,129,129,129,66,60,24
130 DATA 60,126,255,126,60,24,235,24
```

ESC \* ... 27 42 ... 1Bh 2Ah ... Select the **Bit Image Mode** with provided density. You have to provide parameters  $d n m d_1 d_2 ...$ 

Value **d** is horizontal density as shown in this table :

d	DENSITY	DESCRIPTION	MAX DOTS/LINE
0	60 dpi	Single	480
1	120 dpi	Double	960
2	120 dpi	Hi-speed double (same as 1 in Ultimate)	960
3	240 dpi	Quadruple	1920
4	80 dpi	CRT screen	640
5	72 dpi	Plotter	576
6	90 dpi	Hi-res CRT	720

Values  $\mathbf{n}$  and  $\mathbf{m}$  are the 16 bit encoded amount of bitmap data (n is LSB) total = n + m x 256

 $d_1 d_2 \dots$  are the bitmap data to print.

## ESC?nm 27 63 nm 1Bh 3Fh nm

Change density for bitmap commands. Value  $\bf n$  is one from  $\bf K$ ,  $\bf L$ ,  $\bf Y$  or  $\bf Z$ . Value  $\bf m$  is the new density for the command (see table in  $\bf ESC$ \* description).

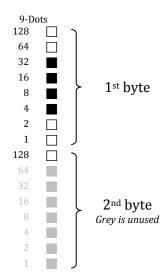

Example, to change density of ESC L to 80dpi:

```
10 OPEN1,4
20 PRINT#1,CHR$(27);CHR$(63);"L";CHR$(4)
30 CLOSE1
```

ESC ^ ... 27 94 ... Select the **Bit Image Mode** using all the 9 pin of the head. You have to provide parameters  $\mathbf{d}$   $\mathbf{n}$   $\mathbf{m}$   $\mathbf{h}_1 \mathbf{l}_1 \mathbf{h}_2 \mathbf{l}_2 \dots$ 

**1Bh 5Eh ...** Value **d** is density. Only 0 and 1 are allowed for single (60dpi) or double density (120 dpi).

Values  $\bf n$  and  $\bf m$  are the 16 bit encoded amount of data (n is LSB) total = n + m x 256  $\bf h_1 \ l_1 \ h_2 \ l_2 \ ...$  are the bitmap data to print. Values  $\bf h_n$  encode the upper 8 dots and values  $\bf l_n$  encode the lower dot in the MSB bit (2<sup>7</sup>=128). This needs double of data for just one more dot.

#### 6.2.5. Charset selection

FX-80 emulation uses ASCII7 to encode characters. This allows only 128 combinations to address characters. When MSB is set to 1 the character is printed using Italic (MSB is  $2^7=128$ ).

**ESC 7** 

Select Basic character table. This is the default charset for FX-80 printer.

27 55

1Bh 37h

10 OPEN1,4

20 PRINT#1, CHR\$(27); CHR\$(55);

30 CLOSE1

ESC R n 27 82 n 1Bh 52h n Select National character table. Value **n** selects the character table :

n	NATIONAL CHARACTER TABLE
0	USA
1	France
2	Germany
3	UK
4	Denmark I
5	Sweden
6	Italy
7	Spain
8	Japan
9	Norway
10	Denmark II

See national charset changes compared to basic charset in chapter 10.3

10 OPEN1,4

20 PRINT#1, CHR\$(27); CHR\$(82); CHR\$(1); "FRENCH CHARSET"

30 CLOSE1

ESC I 1 27 73 1 1Bh 49h 01h Enable the extension of the character table. Parameter 1 can be passed using the '1' character (33, 31h). See table in chapter 10.2 for details about extended charset.

10 OPEN1,4

20 PRINT#1, CHR\$(27); CHR\$(73); CHR\$(1); "EXTENDED CHARSET ENABLED"

30 CLOSE1

ESC I 0 27 73 0 1Bh 49h 00h Disable the extension of the character table. Parameter 0 can be passed using the '0' character (32, 30h).

10 OPEN1,4

20 PRINT#1, CHR\$(27); CHR\$(73); CHR\$(0); "EXTENDED CHARSET DISABLED"

30 CLOSE1

ESC 6 27 54 1Bh 36h Extend only the italic part of the printable charset

This command is ignored by Ultimate-II MPS Printer Emulation.

10 OPEN1,4

20 PRINT#1, CHR\$(27); CHR\$(54);

30 CLOSE1

#### 6.2.6. Character creation, Down Line Loading (DLL)

All the commands related to character creation are ignored in the Ultimate-II MPS Printer Emulation. The commands are understood and correctly interpreted but ignored to skip them gently.

ESC: 000 27 58 0 0 0 1Bh 3Ah 0 0 0 Copy standard character generator from ROM to RAM.

This command is ignored by Ultimate-II MPS Printer Emulation.

ESC & 0 27 38 0 1Bh 26h 00h This code has to be followed by parameters n m a  $p_1$   $p_2...p_{11}$  which represents decimal byte codes to describe characters to load.

**0** is code 0, always present.

**n** ASCII code of first redefined char

**m** ASCII code of last redefined char (n=m if only one char to define)

next parameters are repeated for each defined char.

This parameter tells which needles have to be used to print that character. Head has 9 needles of which 8 can be used here.

a = 0 : use the 8 upper needlesa = 1 : use the 8 lower needles

**p**<sub>1</sub> **p**<sub>2</sub>...**p**<sub>11</sub> Represents the 11 columns defining the dots printed for the character.

In the 8x11 matrix you have to remind that a dot active in a column cannot be active in the next column to let the head recycle. Ultimate-II MPS Printer emulator does not suffer from this limitation.

ESC % n 27 37 n 1Bh 25h n If n=1 select RAM (special characters) and if n=0 select ROM (standard characters) This command is ignored by Ultimate-II MPS Printer Emulation.

6.2.7. Other commands

**Select the printer**. Wake up the printer if the printer has been disabled with DC3.

17 This command is ignored by Ultimate-II MPS Printer Emulation.

11h

DC3 **Suspend the printer**. The printer will ignore the input data until DC1 is sent. 19 This command is ignored by Ultimate-II MPS Printer Emulation. 13h CAN **Cancel** the current job and clear printer buffer. 24 This command is ignored by Ultimate-II MPS Printer Emulation. 18h ESC =Force **bit 7** (MSB) to 0. All data received will have its bit 7 cleared except commands. This command is ignored by Ultimate-II MPS Printer Emulation. 2761 1Bh 3Dh ESC > Force **bit 7** (MSB) to 1. All data received will have its bit 7 set except commands. This command is ignored by Ultimate-II MPS Printer Emulation. 27 62 1Bh 3Eh ESC# Clear **bit 7** (MSB) forcing. This command is ignored by Ultimate-II MPS Printer Emulation. 2735 1Bh 23h ESC < Set **left to right** printing for one line. 2760 This command is ignored by Ultimate-II MPS Printer Emulation. 1Bh 3Ch ESC @ Initialize the printer. Set all parameters to default values. Paper and head are not 2764 moved. 1Bh 40h ESC U n Select Mono/Bidirectional printing. 27 85 n This command is ignored by Ultimate-II MPS Printer Emulation. 1Bh 30h n n=0: bidirectional n=1: mono-directional (left to right) for better alignment. ESC i n Immediate character printing ON/OFF like a typewriter. 27 105 n This command is ignored by Ultimate-II MPS Printer Emulation. n=1: immediate printing ON (incompatible with continuous paper feeding) 1Bh 69h n n=0: immediate printing OFF Half speed printing ON/OFF to make less noise. ESC s n This command is ignored by Ultimate-II MPS Printer Emulation. n=1: half speed n=0 : full speed DEL Delete the last printable character from buffer. This command is ignored by Ultimate-II MPS Printer Emulation. 127 7Fh

# 7. IBM Graphics Printer commands

This chapter describes the commands the printer can understand when using the IBM Graphics Printer emulation. The power of IBM printers resides in its charsets using ASCII8.

## 7.1. Secondary address

Secondary address on OPEN command is not used by IBM Graphics Printer emulation.

## 7.2. Commands

#### 7.2.1. Graphical operations

ESC G 27 71 1Bh 47h	Select the <b>Double Strike</b> print mode. Characters are printed twice and paper is lifted 1/216" between the two passes.  10 OPEN1,4 20 PRINT#1,CHR\$(27);chr\$(71);"DOUBLE STRIKE" 30 CLOSE1  double strike
ESC H	Disable <b>Double Strike</b> print mode
27 72 1Bh 48h	10 OPEN1,4 20 PRINT#1,CHR\$(27);chr\$(72); 30 CLOSE1

### 7.2.4. Graphic Bitmap

IBM Graphics Printer emulation prints bitmap data the same way as EPSON FX-80. An image is defined by a bit array of 8 rows. Each column is encoded in a byte, MSB is up. Horizontal definition can be one of 60, 120 or 240 dpi. Vertical definition is 72 dpi. See Graphic Bitmap for EPSON page 26 for details.

ESC K ... Select the Bit Image Mode in simple density (60 dpi). You have to provide

27 75 ... parameters  $n m d_1 d_2 ...$ 

**1Bh 4Bh ...** Values **n** and **m** are the 16 bit encoded amount of data (n is LSB) total =  $n + m \times 256$ 

 $\mathbf{d_1} \, \mathbf{d_2} \dots$  are the bitmap data to print.

See EPSON command description page 26 for an example.

ESC L ... Select the Bit Image Mode in double density (120 dpi), half speed. You have to

27 76 ... provide parameters  $\mathbf{n} \mathbf{m} \mathbf{d}_1 \mathbf{d}_2 \dots$ 

**1Bh 4Ch ...** Values **n** and **m** are the 16 bit encoded amount of data (n is LSB) total =  $n + m \times 256$ 

 $\mathbf{d_1} \, \mathbf{d_2} \dots$  are the bitmap data to print.

See EPSON command description page 27 for an example.

ESC Y ... Select the **Bit Image Mode** in double density (120 dpi), normal speed.

27 89 ... On Ultimate-II MPS Printer Emulation, **ESC Y** behaves the same as **ESC L** 

1Bh 59h ...

**ESC Z** ... Select the **Bit Image Mode** in quadruple density (240 dpi), half speed. You have to

27 90 ... provide parameters  $\mathbf{n} \mathbf{m} \mathbf{d}_1 \mathbf{d}_2 \dots$ 

**1Bh 5Ah ...** Values **n** and **m** are the 16 bit encoded amount of data (n is LSB) total =  $n + m \times 256$ 

 $\mathbf{d_1} \, \mathbf{d_2} \dots$  are the bitmap data to print.

See EPSON command description page 27 for an example.

#### 7.2.5. Charset selection

IBM emulation uses ASCII8 to encode characters. This allows 256 combinations to address characters. IBM printers work with 2 character tables. Default is Table 1 described page 56. Table 2 is configurable by the user in Ultimate Printer configuration menu from 6 possible international tables. A command can select Table 2 but no command can change the international setting.

**ESC 7** Select **Table 1** character set. This is the default charset for IBM printers.

# **16. Technical Specifications**

**Output Type** PNG file 2-bit depth (4 grey levels) with lossless compression using

LodePNG written by Lode Vandevenne (http://lodev.org/lodepng/)

typical file size range is 30kB - 140kB

**Page size** 1984 x 2580

**Printable area size** 1920 x 2160 (80 PICA characters and 60 lines at 1/6")

Horizontal Resolution 240 dpi

**Vertical Resolution** 216 dpi

**Physical ratio** A4 (21cm x 29,7cm)

**Character matrix** 8V x 11H in draft mode

16V x 12H in NLQ mode

**Print pitches** Pica, 10 char/in, 80 char/line

Elite, 12 char/in, 96 char/line Micro, 15 char/in, 120 char/line

Condensed, 17.1 char/in, 137 char/line Pica Compressed, 20 char/in, 160 char/line Elite Compressed, 24 char/in, 192 char/line Micro Compressed, 30 char/in, 240 char/line

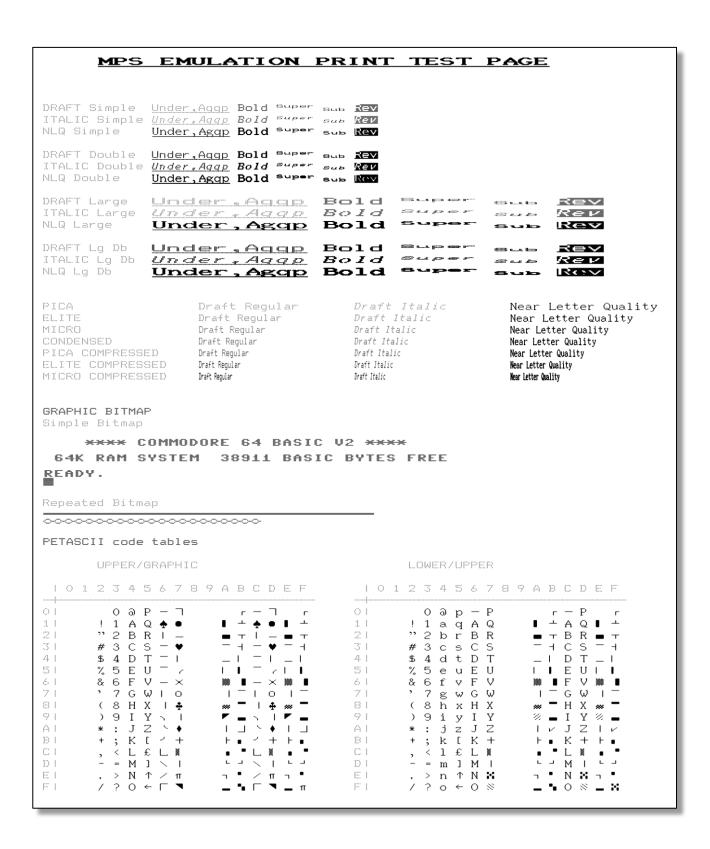

**Printing styles** Boldface

Double width Superscript Subscript Double strike Underlined Italic

Reversed Overlined

## 17. Print Sample

With Printer Ink Density set to Medium. Emulation is Commodore MPS.
